Abstract

PROBLEM TO BE SOLVED: To obtain a lipophilic inorg. filler well swollen with a small amt. of org. cations and improving the heat resistance and rigidity of a composite resin compsn. having a high aspect ratio.

SOLUTION: Org. cations are intercalated into a swellable silicate represented by the formula [Aa (Xb Yc) (Si_{4-d} Al_d)O₁₂ (OHe F_{2-e})] and having $>=2\mu\text{m}$ average grain diameter of single crystal grains, 70-250 \AA /charge charge density and a smectite structure to obtain the objective lipophilic inorg. filler. In the formula, $0.2\leq a\leq 0.7$, $0\leq b\leq 3$, $0\leq c\leq 2$, $0\leq d\leq 4$, $0\leq e\leq 2$, A is at least one cation selected from among alkali metal ions and alkaline earth metal ions, X and Y are cations entering into each octahedron in the smectite structure, X is at least one among Mg, Fe, Mn, Ni, Zn and Li, and Y is at least one among Al, Fe, Mn and Cr.
